

What I need from you

web-studio → SaaS · repo `fringil2026/Renatus` · path chosen: **full production infra, recommended vendor stack** · 2026-06-21

Everything here needs **you** — accounts, logins, secret keys, or money. Everything else I can build. Hand me items in any order; each is an independent seam I wire the moment it arrives. **Not needed right now** (per your choices): outreach tools (Apollo/Reply.io) and final pricing.

Already done

 GitHub repo created, `main + saas-foundation` pushed, `gh` authed, **PR #1 open**.

1 · Logins to run yourself — interactive; run in your own Terminal

These let me run real diagnostics, builds, and deploys from this machine once you're signed in:

- `claude` — sign in. **Unblocks Phase 2** (proves headless Claude builds actually run).
- `wrangler login` — your Cloudflare account (publishing rebuilt client sites + R2 storage).
- `python3 -m playwright install chromium` — one command; enables the scrape/diagnostic engine.

2 · Hosting — get the funnel publicly live

#	SERVICE	WHAT TO DO	GIVE ME
1	Render (API host)	Sign up → New → Blueprint → point at repo (uses committed <code>render.yaml</code>)	the public API URL
2	Vercel (web app)	Sign up → Import repo → Root Directory = <code>web</code> → Deploy	the *.vercel.app URL
3	PageSpeed Insights key	Google PSI → “Get a Key” (free)	the API key

3 · Production data & infra — the “full infra” choice

#	SERVICE	WHAT TO DO	GIVE ME
4	Neon (Postgres)	Create a project at neon.tech	connection string (DSN)
5	Cloudflare R2	R2 → create a bucket + S3-compatible API token	account id, bucket, access key id, secret, endpoint
6	Clerk (auth)	Create an app at clerk.com	publishable key, secret key, JWKS/issuer URL

Temporal/Inngest durable workers + Fly build sandbox come later, at scale — I'll flag when needed.

4 · Payments — pricing TBD, placeholders fine

#	SERVICE	WHAT TO DO	GIVE ME
7	Stripe (test mode)	Create a Product + Price (any placeholder amount)	test secret key (sk_test_...), Price ID, webhook signing secret

5 • Decisions still open — before public launch, no rush

- **Pricing** — rebuild fee + monthly subscription (for Stripe + paywall copy).
- **Legal pages** — Privacy Policy + Terms + a physical mailing address (I draft, you own/review).

Handing me secrets: paste them here as you get them (I move them into gitignored env config, never committed) — or ask me to create an empty `~/web-studio/.env.secrets` template you fill in.

Best to start with: #1 Render + #2 Vercel (gets the funnel publicly live) and the **cLaude login** (unblocks Phase 2). Everything else layers on.

What I do the moment you hand me each: Render URL → wire API_BASE_URL + verify live funnel · Neon DSN → swap in Postgres store · R2 keys → implement artifact store · Clerk keys → wire auth seam · Stripe keys → build checkout + webhook + flip paywall · PSI/wrangler/claude → run a real diagnostic + rebuild end-to-end.
